Chapter 5. Estimation

- § 5.1 Introduction
- § 5.2 Estimating parameters: MLE and MME
- § 5.3 Interval Estimation
- § 5.4 Properties of Estimators
- § 5.5 Minimum-Variance Estimators: The Cramér-Rao Lower Bound
- § 5.6 Sufficient Estimators
- § 5.7 Consistency
- § 5.8 Bayesian Estimation

Chapter 5. Estimation

§ 5.1 Introduction

- § 5.2 Estimating parameters: MLE and MME
- § 5.3 Interval Estimation
- § 5.4 Properties of Estimators
- § 5.5 Minimum-Variance Estimators: The Cramér-Rao Lower Bound
- § 5.6 Sufficient Estimators
- § 5.7 Consistency
- § 5.8 Bayesian Estimation

Motivating example: Given an unfair coin, or p-coin, such that

$$X = \begin{cases} 1 & \text{head with probability } p, \\ 0 & \text{tail with probability } 1 - p, \end{cases}$$

how would you determine the value p?

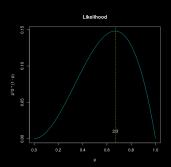

Solutions:

- You need to try the coin several times, say, three times. What you obtain is "HHT".
- 2. Draw a conclusion from the experiment you just made.

Rationale: The choice of the parameter p should be the value that maximizes the probability of the sample.

$$\mathbb{P}(X_1 = 1, X_2 = 1, X_3 = 0) = P(X_1 = 1)P(X_2 = 1)P(X_3 = 0)$$
$$= p^2(1 - p).$$

```
1 # Hello, R.
2 p <- seq(0,1,0.01)
3 plot(p,p^2*(1-p),
4 type="l",
5 col="red")
6 title ("Likelihood")
7 # add a vertical dotted (4) blue line abline (v=0.67, col="blue", lty =4)
9 # add some text
10 text (0.67,0.01, "2/3")
```

Maximize $f(p) = p^2(1 - p)$

=

A random sample of size n from the population – Bernoulli(p):

- $ightharpoonup X_1, \dots, X_n$ are i.i.d.¹ random variables, each following Bernoulli(p).
- ▶ Suppose the outcomes of the random sample are: $X_1 = k_1, \dots, X_n = k_n$.
- ▶ What is your choice of p based on the above random sample?

$$p=\frac{1}{n}\sum_{i=1}^n k_i=:\bar{k}.$$

¹independent and identically distributed

A random sample of size n from the population with given pdf:

- \triangleright X_1, \dots, X_n are i.i.d. random variables, each following the same given pdf.
- a statistic or an estimator is a function of the random sample. Statistic/Estimator is a random variable!

e.g.,

$$\widehat{p} = \frac{1}{n} \sum_{i=1}^{n} X_i.$$

► The outcome of a statistic/estimator is called an **estimate**. e.g.,

$$p_e = \frac{1}{n} \sum_{i=1}^n k_i.$$
