## Chapter 12. The Analysis of Variance

§ 12.1 Introduction

§ 12.2 The F Test

§ 12.3 Multiple Comparisons: Turkey's Method

§ 12.4 Testing Subhypotheses with Contrasts

- John Wilder Tukey (June 16, 1915 July 26, 2000) was an American mathematician best known for development of the Fast Fourier Transform (FFT) algorithm and box plot.
- The Tukey range test, the Tukey lambda distribution, the Tukey test of additivity, and the Teichmüller-Tukey lemma all bear his name.
- 3. He is also credited with coining the term 'bit'.

https://en.wikipedia.org/wiki/John\_Tukey

$\mathcal{N}(\mu_1,\sigma^2)$	$N(\mu_2,\sigma^2)$	${\sf N}(\mu_2,\sigma^2)$
$Y_{11}$	$Y_{12}$	$Y_{1k}$
$Y_{21}$	$Y_{22}$	$Y_{2k}$
$Y_{r1}$	$Y_{r2}$	$Y_{rk}$

Goal For any  $i \neq j$ , test

$$H_0: \mu_i = \mu_j$$
 v.s.  $H_1: \mu_i \neq \mu_j$ 

at the  $\alpha$  level of significance defined as

$$\mathbb{P}\left(\bigcup_{j=1}^{\binom{k}{2}} E_j\right) = \alpha$$

where there are  $\binom{k}{2}$  pairs, and  $E_j$  is the event of making a type I error for the j-th pair.

Goal' Simultaneous C.I.'s for  $\binom{k}{2}$  pairs of means:

Given  $\alpha$ , find  $I_{ij}$ , the C.I. for  $\mu_i - \mu_j$  (with  $i, j = 1, \dots, k$  and  $i \neq j$ ), s.t.

$$\mathbb{P}(\mu_i - \mu_j \in I_{ij}, \forall i, j = 1, \cdots, k, i \neq j) = 1 - \alpha.$$

#### ??? Why not the standard pair-wise two-sample t-test?

Suppose  $\mathbb{P}(E_i) = \alpha_*$ . Then

$$\alpha = \mathbb{P}\left(\bigcup_{j=1}^{\binom{k}{2}} E_j\right) = 1 - \mathbb{P}\left(\bigcap_{j=1}^{\binom{k}{2}} E_j^c\right) \approx 1 - \prod_{j=1}^{\binom{k}{2}} \mathbb{P}(E_j^c) = 1 - (1 - \alpha_*)^{\binom{k}{2}}$$

Hence,

$$\alpha_* \approx 1 - (1 - \alpha)^{1/\binom{k}{2}}$$

E.g., 
$$\alpha = 0.05$$

## Bonferroni's method

- A straightforward method

$$\mathbb{P}\left(\mu_{i}-\mu_{i}\in I_{ji}, \forall i\neq j\right)$$

$$\mathbb{P}\left(\bigcap_{i\neq j}\mu_i-\mu_j\in I_{ij}\right)$$

$$1 - \mathbb{P}\left(\bigcup_{i \neq j} \mu_i - \mu_j \not\in \mathit{I}_{ij}\right)$$

$$1 - \sum_{i \neq j} \mathbb{P} \left( \mu_i - \mu_j \not\in I_{ij} \right)$$

$$1 - \binom{k}{2} \alpha_*$$

1. If we choose  $\alpha_* = \alpha/\binom{k}{2}$ ,

2. let  $I_{ii}$  be the  $(1 - \alpha_*)100\%$  C.l.  $i \neq j$ 

$$\mathbb{P}\left(\mu_i - \mu_j \in I_{ij}, \ \forall i \neq j\right)$$

$$1 - {k \choose 2} \alpha_*$$

$$\binom{k}{2}\alpha_*$$

$$1 - \alpha$$

Remark This is an approximation. The resulting C.I. are in general too wide.

The exact, and much more precise, solution is given by J.W. Turkey.

One can also construct simultaneous C.I. for all possible linear combinations of the parameters  $\sum_{j=1}^{k} c_j \mu_j$ , this can be acchieved by **Scheffé's method**. A simple verson is given in §12.4.

# Tukey's HSD (honestly significant difference) test

Let's construct  $(1 - \alpha)100\%$  C.I.'s simultaneously for all pairs.

$$\mathbb{P}\left(\left|(\overline{\mathbf{Y}}_{.i} - \mu_i) - (\overline{\mathbf{Y}}_{.j} - \mu_j)\right| \leq \mathcal{E}, \quad \forall i \neq j\right) = 1 - \alpha$$

$$\parallel$$

$$\mathbb{P}\left(\max_{i}(\overline{\mathbf{Y}}_{.i} - \mu_i) - \min_{j}(\overline{\mathbf{Y}}_{.j} - \mu_j) \leq \mathcal{E}\right)$$

$$\parallel$$

$$\mathbb{P}\left(\max_{i} \overline{\mathbf{Y}}_{.i} - \min_{j} \overline{\mathbf{Y}}_{.j} \leq \mathcal{E}\right)$$

 $\Longrightarrow$  Needs to study ...

Def. Let  $W_1, \dots, W_k$  be k i.i.d. r.v.'s from  $N(\mu, \sigma^2)$ . Let R denote their range:

$$R = \max_{i} W_{i} - \min_{i} W_{i}.$$

Let  $S^2$  be an unbiased estimator for  $\sigma^2$  independent of the  $W_i$ 's and based on  $\nu$  df. Define the **Studentized range**,  $Q_{k,\nu}$ , to be the ratio:

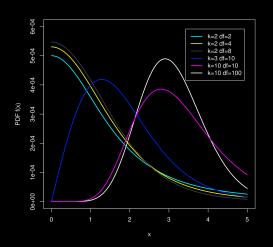

$$Q_{k,\nu}:=rac{R}{S}.$$

**Remark** 0.1 We need  $R \perp S$  to mimic Student's t-distribution. 0.2 In the following  $\nu = n - k = rk - k = r(k - 1)$ .  $Q_{k,\nu} \sim$  Studentized range distribution with parameters k and  $\nu$ .

*k*: number of groups.

 $\nu$ : degrees of freedom.

Let's find one example that all requirements of the  $Q_{k,\nu}$  are satisfied.

1. Take 
$$W_j = \overline{Y}_{\cdot j} - \mu_j$$
,  $j = 1, \dots, k \implies W_j \sim N(0, \sigma^2/r)$ .

- 2. *MSE* or the pooled variance  $S_p^2$  *MSE/r* is an unbiased estimator for  $\sigma^2$   $\sigma^2/r$  is  $\bot \{\overline{Y}_i\}_{i=1,\dots,k}$ , hence  $\bot \{W_i\}_{i=1,\dots,k}$
- **3**. *df* of *MSE* is equal to n k = kr k = k(r 1).

$$\implies \frac{\max_i W_i - \min_j W_j}{\sqrt{MSE/r}} \sim \text{Studentized range distribution}(k, rk - k)$$

$$\mathbb{P}\left(\frac{\max_{i}W_{i} - \min_{j}W_{j}}{\sqrt{MSE/r}} \leq Q_{\alpha,k,rk-k}\right) = 1 - \alpha$$

$$\| \|$$

$$\mathbb{P}\left(\max_{j}W_{i} - \min_{j}W_{j} \leq \frac{Q_{\alpha,k,rk-k}}{\sqrt{r}}\sqrt{MSE}\right)$$

$$\| \|$$

$$\mathbb{P}\left(|W_{i} - W_{j}| \leq \frac{Q_{\alpha,k,rk-k}}{\sqrt{r}}\sqrt{MSE}, \ \forall i \neq j\right)$$

$$\| \|$$

$$\mathbb{P}\left(\left|\left(\overline{Y}_{.i} - \overline{Y}_{.j}\right) - (\mu_{i} - \mu_{j})\right| \leq \frac{Q_{\alpha,k,rk-k}}{\sqrt{r}}\sqrt{MSE}, \ \forall i \neq j\right)$$

$$\| \|$$

$$\mathbb{P}\left(\overline{\mathbf{Y}}_{\cdot i} - \overline{\mathbf{Y}}_{\cdot j} - \frac{Q_{\alpha,k,rk-k}}{\sqrt{r}}\sqrt{\textit{MSE}} \leq \mu_i - \mu_j \leq \overline{\mathbf{Y}}_{\cdot i} - \overline{\mathbf{Y}}_{\cdot j} + \frac{Q_{\alpha,k,rk-k}}{\sqrt{r}}\sqrt{\textit{MSE}}, \ \forall i \neq j\right)$$

Therefore, for all  $i \neq j$ , the  $100(1 - \alpha)\%$  C.I. for  $\mu_i - \mu_j$  is

$$\overline{\mathbf{Y}}_{.i} - \overline{\mathbf{Y}}_{.j} \pm rac{Q_{lpha,k,rk-k}}{\sqrt{2}} \sqrt{\textit{MSE}} \sqrt{rac{2}{r}}$$

To test  $H_0: \mu_i = \mu_j$  for specific  $i \neq j$ , reject  $H_0$  in favor of  $H_1: \mu_i \neq \mu_j$  if the C.I. does NOT contain 0, at the  $\alpha$  level of significance.

Note: When sample sizes are not equal, use the Tukey-Kramer method:

$$\overline{\mathbf{Y}}_{\cdot i} - \overline{\mathbf{Y}}_{\cdot j} \pm rac{Q_{lpha,k,\mathit{rk}-k}}{\sqrt{2}} \sqrt{\mathit{MSE}} \sqrt{rac{1}{\mathit{r}_i} + rac{1}{\mathit{r}_j}}$$

E.g. 2 A certain fraction of antibiotics injected into the bloodstream are "bound" to serum proteins. This phenomenon bears directly on the effectiveness of the medication, because the binding decreases the systemic uptake of the drug. Table below lists the binding percentages in bovine serum measured for five widely prescribed antibiotics. Which antibiotics have similar binding properties, and which are different?

Table 12.3.1							
	Penicillin G	Tetra- cycline	Strepto- mycin	Erythro- mycin	Chloram- phenicol		
	29.6	27.3	5.8	21.6	29.2		
l	24.3	32.6	6.2	17.4	32.8		
l	28.5	30.8	11.0	18.3	25.0		
	32.0	34.8	8.3	19.0	24.2		
$T_{.j}$	114.4	125.5	31.3	76.3	111.2		
$\overline{Y}_{.j}$	28.6	31.4	7.8	19.1	27.8		

To answer that question requires that we make all  $\binom{5}{2} = 10$  pairwise comparisons of  $\mu_i$  versus  $\mu_j$ . First, *MSE* must be computed. From the entries in Table 12.3.1,

$$SSE = \sum_{j=1}^{5} \sum_{i=1}^{4} (Y_{ij} - \overline{Y}_{.j})^{2} = 135.83$$

so MSE = 135.83/(20-5) = 9.06. Let  $\alpha = 0.05$ . Since n - k = 20 - 5 = 15, the appropriate cutoff from the studentized range distribution is  $Q_{.05,5,15} = 4.37$ . Therefore,  $D = 4.37/\sqrt{4} = 2.185$  and  $D\sqrt{MSE} = 6.58$ .
